Get to know your fellow attendees!

Let's kick things off by introducing ourselves and connecting with new faces. 🤝 ✨

RECAP: Containerization

Recap to Containers

Containerization is a lightweight form of virtualization

Docker is a leading platform for containerization. It provides tools and a platform to develop, deploy, and run applications in containers.

Advantages

- Portability
- Isolation
- Resource Efficiency
- Rapid Development

What is Docker?

What is Docker?

- Docker is a **containerization platform** that simplifies the deployment and management of applications.
- It **packages applications and their dependencies** into isolated containers, ensuring consistency across different environments.
- Docker containers are **lightweight, portable**, and can **run consistently** from development to production.
- Docker is a game-changer for DevOps, enabling faster development, deployment, and scaling of applications.

→ **Key Concepts:**

- ◆ **Images:** Read-only templates that contain application code and dependencies.
- ◆ **Containers:** Instances of Docker images that run in isolation.
- ◆ **Dockerfile:** A script used to build Docker images.
- ◆ **Registries:** Repositories for storing and sharing Docker images.

Docker CLI

Docker CLI (Command Line Interface)

- The Docker CLI is the command-line tool used to interact with Docker and manage containers and images.
- The Docker CLI provides powerful capabilities for managing Docker resources, making it an essential tool for developers and administrators.
- Learning to use the Docker CLI efficiently is key to working effectively with Docker containers.

Common Docker CLI Commands

docker pull : Fetches a Docker image from a registry.

docker run : Creates and starts a container from an image.

docker ps : Lists running containers.

docker images : Lists available images.

docker build : Builds a Docker image from a Dockerfile.

docker stop and **docker start** : Stops and starts containers.

docker rm : Removes containers.

docker rmi : Removes images.

docker exec : Executes a command in a running container.

Let's Create Your First Container! 🚀

It's time to get hands-on! 🔥 Fire up your Docker Desktop or Docker environment and join us in creating your very own container.

Don't worry; it's a fantastic way to get practical experience with Docker and containerization. Get ready to dive in! 🌟

Can you guys Think and Answer these

- What if the app within the container reaches its processing limit ?
- What if we have multiple containers and they all are somehow dependent on each other for processing ?
- How will we be creating containers if we have to create 1000+ containers of 10 images ?

System Scaling

Scaling Systems and Its Importance

What is Scaling?

Scaling is the process of adjusting system resources to handle increased load or demand.

Why Scale?

- **Handle Growth:** As user traffic or data volume grows, scaling ensures your system can keep up.
- **Improve Performance:** Scaling can enhance system responsiveness and reduce latency.
- **Maintain Reliability:** Ensures your system remains available even during high traffic or load spikes.

Scaling is essential for meeting user expectations and maintaining a robust, responsive system.

“Flipkart fumbles on the big day as server fails”

October 6, 2014

Cart flipped

- Flipkart kicked off its BigBillionDay campaign on the day Amazon's founder Jeff Bezos came calling in Bangalore
- It was planned for October 6 (610), the flat number from where Sachin and Binny Bansal started Flipkart 
- Products were priced as low as ₹1, and in some cases, discounts were as high as 80 per cent
- BigBillionDay suffered technical glitches despite Flipkart deploying an additional 1,000 engineers
- The sale came in for flak on social media, with the Twitterati terming it a sham or a scam

Vertical Scaling

(increase size of instances)

Horizontal Scaling

(add more instances)

Q & A Session

Ask your Questions

```
lookup.KeyValue  
f.constant(['em  
=tf.constant([G  
lookup.StaticV  
_buckets=5)
```

The background of the slide is a solid blue color. It is decorated with several stylized white clouds of various sizes and shapes, scattered across the top and bottom portions of the frame. The clouds have a soft, puffy appearance with simple outlines.

Thanks for Joining !!!
